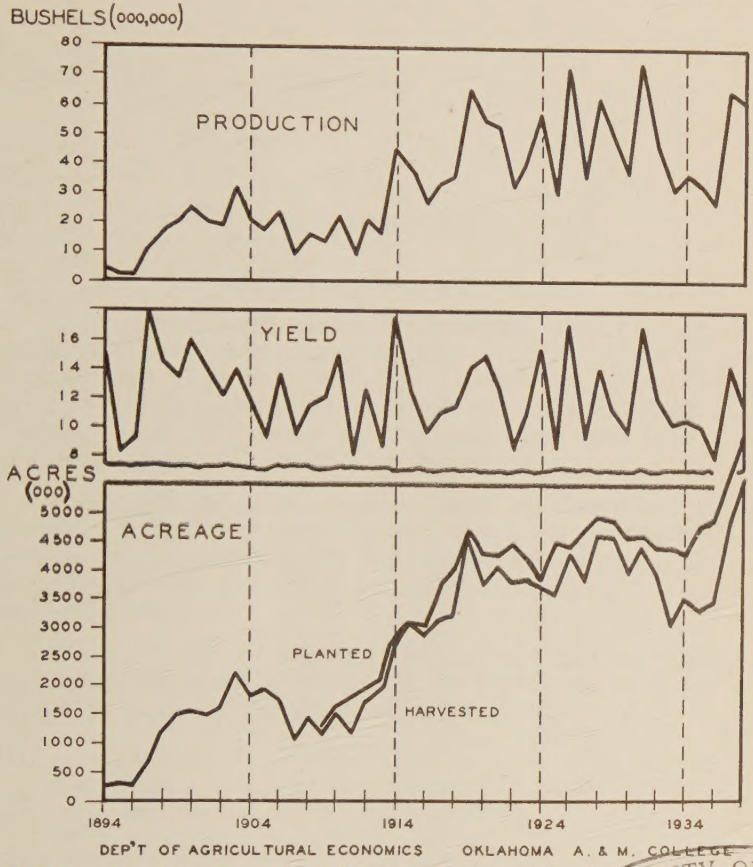
Wheat Production in Oklahoma, 1894-1938

By K. D. BLOOD and MARJORIE LEE HILL



Oklahoma has been a major wheat producing state since about 1914. Acreage, average yield per acre, and production since 1894 are shown in the above chart.

INTRODUCTION

Method of Making Estimates

The estimates of acreage harvested and production of wheat here presented are based upon (1) the Census enumerations of 1920, 1930, and 1935, (2) available data from the Agricultural Adjustment Administration for the years 1933 to 1938 inclusive, and (3) current reports from crop reporters relating to acreage, yield, and production in each year.

Since Census enumerations relate to harvested acreage, planted acreage is obtained by an adjustment of the harvested acreage to a planted base by the amount abandoned. The yield per planted acre is derived by dividing the production by the planted acreage.

The estimates of acreage planted, acreage harvested, and production by counties needed to be reconciled with the state estimates made by the Crop Reporting Board.

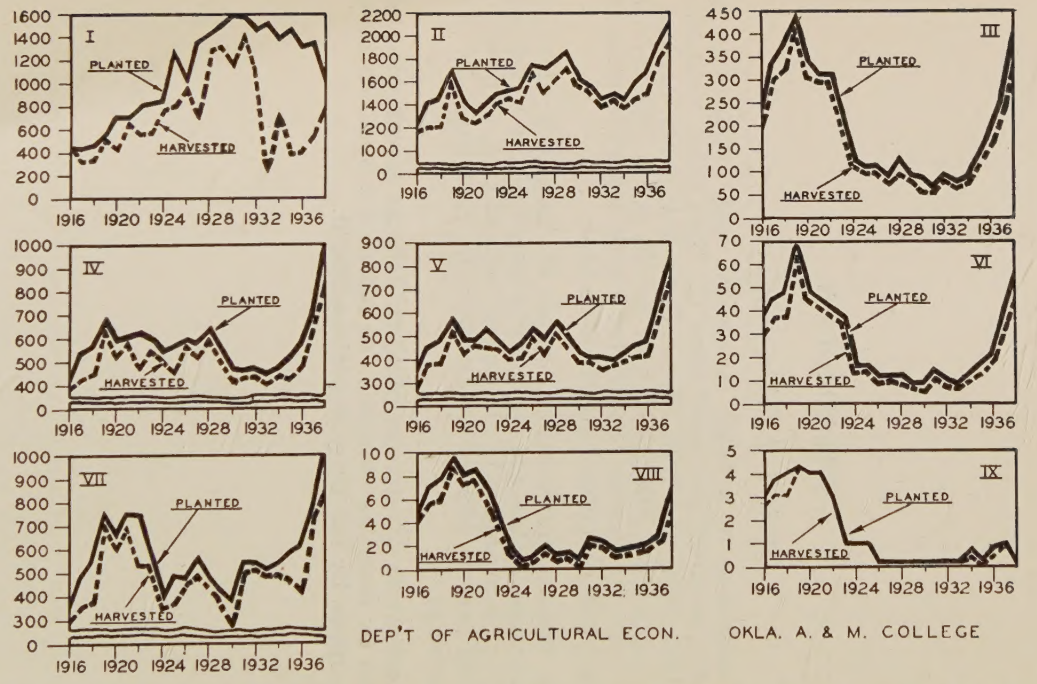

Figure 1. Wheat acreages planted and harvested in Oklahoma, 1916-1938, by crop reporting districts. Major differences in wheat production occur between the eastern part of Oklahoma (Districts III, VI, VIII, and IX) and the rest of the state. Locations of the state's nine crop reporting districts are shown in Figure 2, page 7.

WHEAT PRODUCTION IN OKLAHOMA, 1894-1938

By K. D. BLOOD and MARJORIE LEE HILL*

Acreages, Yields, and Production

Oklahoma became a major wheat producing state about 1914 when price increases caused a material expansion in acreage. The acreage rose from 2,701,000 acres to 4,960,000 acres between 1914 and 1936, and in 1938 about six million acres were planted to this crop. The harvested acreage has varied greatly from year to year, depending largely on the area abandoned.

Since 1914, production has shown a variation from 27,265,000 bushels in 1916 to 74,919,000 bushels in 1931. The lowest yield per acre harvested was 8.0 bushels in 1936 and the highest was 17.5 in 1914.

In general, acreage, yield, and production tended to vary in counties in conformity with the state, although in some years significant departures occurred, particularly in abandonment and yield per acre.

Acreage Changes and Price Movements

Since 1894, Oklahoma's wheat acreage has been characterized by four separate trends (See graphs on cover). The first, from 1894 to about 1910, was gradually upward. From the latter date until the World War peak of 1919, acreage planted increased sharply and steadily. After the war, planted acreage levelled off at between 4 and 5 million acres, with the main deviation occurring apparently in response to favorable prices in the middle twenties. The fourth change in acreage is the spectacular increase beginning in 1934 and continuing into 1938.

When acreages planted and harvested are plotted by crop reporting districts (Figure 1), a good many sectional differences in trends become apparent. On the basis of both these differences and the importance of wheat within the various districts, it appears that the state may be roughly divided into two areas in regard to wheat production. They are (1) the eastern one-third and the south central portion, comprising Districts III, VI, VIII, and IX, and (2) the remainder of the state. In the first-named section no district averaged as much as 200,000 acres harvested in the period 1916-1938. In the second-named area,

* Mr. Blood is agricultural statistician at Oklahoma City, Oklahoma, for the Agricultural Marketing Service, United States Department of Agriculture. Miss Hill at the time this manuscript was prepared was research assistant in agricultural economics, Oklahoma Agricultural Experiment Station.

all districts averaged over 400,000 acres harvested for the same period. (Figure 2.) The difference between the two areas is evident not only in the magnitude of production but also in acreage shifts, which follow fundamentally different patterns in each area.

THE WORLD WAR. District figures are not available for the period during which took place the first gradual and statewide increase in production. However, the other three major acreage shifts mentioned above are shown by districts in Figure 1. The outstanding feature of the World War price changes is the far greater reaction made to them in the eastern part of Oklahoma, that is, in the minor wheat producing section, than in the more important producing area. This increase in the eastern section of the state was much more important within that section than for the state as a whole. For instance, the increase in acreage planted between 1918 and 1919 in District III was from 325,000 to 425,000, or 100,000 acres, while in District II, the most important wheat producing area, the increase in planted acreage was over four times as much, although it does not appear to be in Figure 1. Among the five districts in the western part of Oklahoma, wartime increases showed up most sharply in District VII in the extreme southwestern corner of the state. It is here, where cotton is a strong competitor for land use, that other price responses show up more definitely than in any other district in this portion of the state.

THE TWENTIES. The third major movement in Oklahoma wheat production, occurring during the twenties, took place almost exclusively in the western part of the state. In this period, District II, Oklahoma's center of grain production, attained a higher level of acreage planted than during the war years. The Panhandle district likewise increased considerably, but probably this was due as much to the widespread replacement of horses with tractors in the area as it was to price conditions.

THE MIDDLE THIRTIES. With the exception of the extreme northwestern and southeastern portions of Oklahoma, all districts showed a marked increase in acreage planted during the middle thirties, with the upward movement for most districts beginning in 1933 or 1934 and suddenly accelerating in 1937. In conjunction with this movement, wheat prices rose steadily from 1933 until 1937 when they averaged over $1.00 for the year (Figure 3). These five years make up the longest period of regularly rising Oklahoma farm wheat prices since 1910, the first year for which such data are available. Although other factors such as the method of making AAA

Figure 2. Acreage of wheat harvested by crop reporting districts in Oklahoma, average 1916-1938. Over one-third of the State's total wheat acreage is found in Crop Reporting District II.

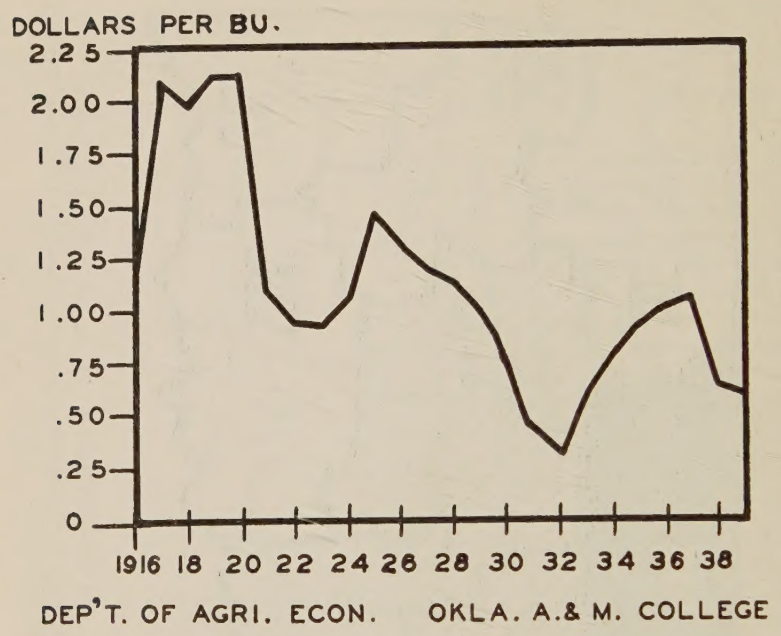

Figure 3. Annual average of farm wheat prices in Oklahoma, 1916 to 1939. During the entire period shown, prices generally have followed a downward trend.

allotments may have entered into the picture, it is notable that after prices again dropped in 1938 and 1939, acreage figures for the state as a whole were down from the 1938 high of 5,607,000 to 4,317,000 and 3,885,000 for 1939 and 1940 respectively.

For the entire period 1916-1938, several long-time acreage adjustments by districts stand out. For example, in the northwestern part of the state, drought and windstorms have caused heavy abandonment since 1932, with the result that acreage planted has declined since that year. Another feature is the occurrence in District VII, the state's chief cotton producing area, of continual and rather marked fluctuations in wheat acreage. This is no doubt to be expected in any locality which can produce an alternative cash crop. A third aspect of wheat production is the general upward trend of acreage in District II (wherein is found over one-third of the state's total acreage) in the face of a continued downward trend in prices (Figure 3). This last situation possibly suggests the maturing of types of farming in District II toward increased localization of production.
